

Comark C22 Food Thermometer now meets EN13485:2002

Comark's best-selling C22 food thermometer has been improved in response to European Standard EN13485:2002. The standard dictates that all temperature monitoring instruments used in the transport, warehousing and storage of Quick Frozen Foodstuffs comply and furthermore, documents must be kept to prove that the instruments comply. The C22 food thermometer is fully compliant, rated dust and waterproof to IP65, featuring a built-in protective rubber boot and incorporating BioCote® antimicrobial to reduce the risk of cross contamination. The improved durability provided by the IP65 rated case also makes the C22 a great choice for busy food production areas. A dual purpose 'EN compliant' air/penetration probe is available from Comark. The temperature range of the instrument when used with the PX37L air/penetration probe is -50°C to +150°C, which makes it ideal for both air and product measurement applications right across the cold chain
